

Ex 5: Building Reports, Dashboards, and Custom Pages (UI Builder) for the Application

Topic: Patient Appointment Booking Form — Reporting & Dashboard Use Case

1. Aim

To create two additional report views on top of the Appointment_Booking_Form — a Kanban board grouped by Department and a Calendar view for tracking day-wise bookings — and to build a custom Dashboard page with Zoho Creator's UI Builder (Page Builder) so that front-desk staff and doctors get a quick, visual read on appointment volume, patient age spread, and how load is distributed across departments.

This directly supports the clinic's need to move away from a single flat list of bookings toward views that are easier to act on — letting staff glance at the day's schedule, notice which departments are getting busy, and follow overall booking trends without having to open each record one by one.

2. Procedure

Step 1: Set up the Kanban report — A new report called department_view was created on the Appointment_Booking_Form and its report type was set to Kanban.

Step 2: Configure the Kanban settings — In the Report Builder, the Group Columns By option was set to Department, so every column on the board corresponds to one department (General Medicine, Cardiology, Dermatology, Pediatrics, Orthopedics). The Empty Value Column and Deleted Value Column options were both switched off to keep the board free of clutter.

Step 3: Set up the Calendar report — A second report, Todays_Appointments, was created and its type was set to Calendar so bookings could be viewed across a month, week, or day grid.

Step 4: Configure the Calendar settings — The Event title along with the Event starts on and Event ends on fields were mapped to Preferred_Appointment_Date, the Default view was set to Month, and the week was configured to start on Sunday.

Step 5: Launch the Page Builder — A new custom page named Dashboard was added to the application through Zoho Creator's Page Builder (UI Builder), which offers a palette of elements — Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, Button, and Widgets — to design with.

Step 6: Place a heading panel — A Panel element was dropped at the top of the page and set up with the title "Patient Dashboard" along with a personalised welcome label for the signed-in user.

Step 7: Add the chart elements — Two Chart widgets were placed under the panel — a Donut chart showing Appointment Booking Form submissions grouped by date, and a Bar chart plotting patient count against Age.

Step 8: Add the report grid — A Report element linked to the Appointment_Booking_Form Report was placed below the charts so the dashboard also displays the underlying records in the same view.

3. Output

3.1 Report Builder — Kanban Properties for "department_view"

The Kanban Properties panel confirms that Group Columns By is set to Department, with the Empty Value Column, Deleted Value Column, and Record Count Per Column options all hidden to keep the board tidy. This is the configuration screen behind the department-wise grouping seen in the live report.

3.2 Live Kanban report — “department_view”

On the published board, each department appears as its own column, and every patient card (showing name and age) sits in the column matching its booked department, confirming that the grouping configured earlier works as intended on live data.

Figure 2: Live Kanban Report – “department_view”

3.3 Report Builder — Calendar Properties for “Todays_Appointments”

The Calendar Properties screen shows the Event title, Event starts on, and Event ends on fields all bound to Preferred_Appointment_Date, with the Default view set to Month and the week beginning on Sunday. This is what determines how each booking is placed on the calendar grid.

3.4 Live Calendar report — “Todays_Appointments”

In Month view, each sample booking appears directly on its preferred appointment date, which verifies that the date-binding configured in the Calendar Properties panel is working correctly on the published report.

3.5 Page Builder (UI Builder) — designing the Patient Dashboard

The Page Builder screen shows the element palette — Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, and Button — on one side, with the Dashboard page taking shape on the other: a heading panel, a Donut chart and a Bar chart both sourced from the Appointment Booking Form, and a Report table placed underneath.

3.6 Live custom page — “Patient Dashboard”

The published Dashboard page opens with the “Patient Dashboard” heading panel, followed by a Donut chart breaking down bookings by date and a Bar chart plotting patient age, and finally the live Appointment_Booking_Form report grid listing patient records with their contact details — giving staff everything they need on a single screen.

4. Final Result

Two new report views were successfully added on top of the Appointment_Booking_Form: a Kanban board that sorts appointments by Department for quick departmental triage, and a Calendar report that places every booking on its preferred date for day-to-day scheduling.

A custom Dashboard page was also designed using Zoho Creator's UI Builder, bringing together a heading panel, a Donut chart, a Bar chart, and an embedded report grid into one consolidated view of appointment activity and patient age distribution.

All three views were checked in live/preview mode against real sample data, confirming that the Kanban grouping, the calendar's date binding, and the dashboard widgets all render correctly and pull live records from the Appointment_Booking_Form.

The exercise achieved its aim: front-desk staff and doctors now have three complementary, low-code views — grouped, scheduled, and summarised — built without writing any custom code, replacing the earlier need to scroll through one flat report.
